Who This Fund Is For

- Long-term growth investors who are comfortable with a moderate to aggressive risk profile and fluctuations in investment value.
- Investors seeking diversification across South African and international equities, bonds, property and cash within one actively managed portfolio.
- Retirement investors seeking a Regulation 28-compliant portfolio to support long-term savings.
- Investors who value quarterly income distributions alongside capital growth.

About the Fund

The AMETF is a moderate to high-risk multi-asset portfolio designed to achieve medium-term, through-the-cycle capital growth and real returns. It follows a disciplined investment strategy underpinned by fundamental research and the manager's skill and experience to deliver risk adjusted returns that are compliant with regulation 28 limits.

Growth of R100 Since Inception

Source of performance returns: EasyETFs (RF) (Pty) Ltd. Calculated on a net NAV to NAV basis with income reinvested.

Portfolio Manager Commentary

Global equities pulled back in October, with the MSCI All Country World Index falling 1.7% in US dollar terms. Investors grew sceptical of whether the vast capital being committed to AI infrastructure would earn adequate returns, particularly as that spending is increasingly debt-financed. The Nasdaq 100 fell 6.65%, while the S&P 500 fell 0.93%. Energy, consumer staples and healthcare led, while semiconductors and communication services sold off. Emerging markets bore the brunt, led lower by tech-heavy Korea and Taiwan, while Brazil fell sharply after Lula's re-election.

Central banks paused but kept a tightening bias. The Fed held at 3.75%–4.00% on 28 October with two members voting for a hike, and the ECB held its deposit rate at 2.50% after discussing an increase. Despite firmer headline inflation and higher oil prices, government bonds regained their role as a diversifier. The rally was led by the long end, with the US 10-year yield falling 36 basis points to 4.93% against a 30 basis point decline in the two-year to 4.58%. France was the exception, with spreads to Bunds at their widest since 2011. Corporate credit lagged government bonds as concerns over AI financing pushed spreads wider. Within commodities, energy rallied on renewed Middle East tensions, while gold fell, missing out on the safe-haven bid as higher rates weighed on demand.

Locally, the JSE All Share eased 0.82% as precious metals and global technology shares weakened. South Africa nonetheless outperformed the broader MSCI Emerging Markets index (-6.38% in ZAR terms). With no MPC meeting, the focus was the MTBPS, which presented a more constructive fiscal picture. The deficit is forecast at 3.9% of GDP this year, narrowing to 2.5% by decade-end, with debt stabilising and a principles-based fiscal anchor to be legislated next year. Moody's described the statement as credit positive ahead of the 27 November reviews by Moody's and S&P, both of which have positive outlooks. The 10-year yield retreated to 8.57% from 8.77% at end September. With much of the good news priced in, global yields are likely to drive the long end. We continue to prefer the front end and a steeper curve over outright duration. September CPI printed at 4.5%, with core at 4.0%, but higher fuel prices point to a rise in the next print, although fuel-levy relief should provide some offset. We expect the SARB to hold on 19 November, viewing its two hikes this year as insurance against the energy shock rather than the start of a prolonged cycle.

Transaction Costs (TC)	**Accurate figures published 12 months post launch**
Total Investment Charges (TIC = TER + TC)	**Accurate figures published 12 months post launch**

Management fees are quoted excluding VAT. TER, TC and TIC figures are inclusive of VAT, where applicable.

Glossary of Terms

Annualised return — The return an investment would have earned each year, on average, over the stated period.

Benchmark — A reference index or comparator used to assess the portfolio's investment performance.

Beta — A measure of how much the fund moves relative to its benchmark.

Jensen's Alpha — Return earned above what the fund's level of market risk would predict.

Sharpe ratio — Return earned above the risk-free rate per unit of total risk.

Sortino ratio — A risk-adjusted return measure similar to the Sharpe ratio, but which penalises only downside volatility - returns falling below a minimum acceptable return - rather than total volatility.

NAV — Net asset value: the total value of the portfolio less permissible deductions, divided by units in issue.

TER — Total expense ratio: reflects the expenses incurred in the administration and management of the portfolio, expressed as a percentage of its average net asset value.

TC — Transaction costs: the cost of buying and selling the underlying investments, as a percentage of the portfolio.

TIC — Total investment charges: represents the combined TER and TC.

Participatory interest — A unit in a collective investment scheme, representing a share of the portfolio.

Rolling return — The fund's rolling 12-month (1-year) return, measured from every possible starting point in the period, as required by Board Notice 92 of 2014.

Forward pricing — Units are priced at the next valuation point after an instruction is received, not the last known price.

Regulation 28 — Prescribes prudential investment limits applicable to retirement funds assets under the Pension Fund Act including limits on exposure to certain asset classes and investments.

Past performance does not guarantee future results, and different types of investments involve varying risk. Capital is not guaranteed and investments can lose value as well as gain. Take time to do your own research on your investments in order to make informed decisions.

Risk Disclosures

Certain investments, including futures, options, equity swaps and other derivative instruments, may expose the Portfolio to additional risks, including leverage, market volatility, counterparty default, liquidity constraints and valuation risk. The use of derivatives and other financial instruments, whether for hedging, efficient portfolio management or investment purposes, may result in increased exposure to underlying assets and could amplify gains or losses. While derivative instruments may be utilised to manage market risk, reduce effective equity exposure or provide downside protection, there can be no assurance that such strategies will achieve their intended objectives. Adverse market movements, changes in volatility, pricing discrepancies or the failure of counterparties to meet their obligations may negatively affect the Portfolio's performance and result in substantial losses. Investments in foreign securities, where permitted, carry additional risks, including foreign exchange fluctuations, political and economic instability, liquidity constraints, restrictions on the repatriation of funds, differing regulatory and tax environments, settlement risk and limitations on the availability of market information. These risks may adversely affect the value and liquidity of the Portfolio's investments. Investors should be aware that the use of derivatives and other financial instruments does not eliminate investment risk or guarantee capital protection, and the value of their investments may fluctuate.

Market risk — The value of the fund's investments, including equities, is exposed to price movements across the markets in which it invests and may fall as well as rise. Shares in particular are volatile and can lose value quickly.

Currency risk — Where a portfolio invests offshore or holds exposure to foreign currency, movements in the rand against those currencies will affect returns, positively or negatively.

Liquidity risk — Where foreign securities are held there may be constraints on liquidity and on the repatriation of funds.

Political and country risk — Foreign holdings carry macroeconomic, political, tax and settlement risks that differ by jurisdiction.

Credit risk — Where a portfolio invests in bonds or other credit instruments, the issuer may fail to meet its payment obligations, causing a loss to the fund.

Capital risk — There is no guarantee in respect of capital or returns. Investors may get back less than they invested.

Disclaimers

Collective investment schemes in securities (CIS) are generally medium to long-term investments. The value of the participatory interests may go down as well as up and past performance is not necessarily a guide to future performance. CISs are traded at the ruling prices and can engage in scrip lending and borrowing. The CIS may borrow up to 10% of the market value of the portfolio to bridge insufficient liquidity. A schedule of fees, charges and maximum commissions is available on request from EasyETFs (RF) (Pty) Ltd. There is no guarantee in respect of capital or returns in the portfolio. The portfolio may be closed to new investors in order for it to be managed more efficiently in accordance with its mandate. CIS prices are calculated on a net asset basis, which is the total value of all the assets in the portfolio including any income accruals and less any permissible deductions (brokerage, STT, VAT, auditor's fees, bank charges, trustee and custodian fees and the annual management fee) from the portfolio divided by the number of participatory interests in issue. Forward pricing is used.

The Total Expense Ratio (TER) reflects the expenses incurred in the administration and management of the portfolio, expressed as a percentage of its average net asset value. Transaction Costs (TC) reflect the costs incurred in buying and selling the portfolio's underlying investments. Total Investment Charges (TIC) represent the combined TER and TC. A higher TER does not necessarily imply a poor return, nor does a low TER imply a good return. The current TER cannot be regarded as an indication of future TERs.

Exchange traded funds (ETFs) are collective investment schemes listed on a securities exchange and may be bought and sold during exchange trading hours, unlike traditional unit trusts, which are generally transacted at the applicable net asset value (NAV). ETFs trade at market prices that may differ from their NAV, and investors may incur additional costs, including brokerage and other trading charges. This portfolio is actively managed and does not seek to track an index. Its benchmark is used to measure investment performance. The investor acknowledges the inherent risk associated with the selected investments and that there are no guarantees.

Where performance is disclosed, it is calculated on a NAV-to-NAV basis, with income reinvested.

ETFs vs unit trusts: Whilst both unit trusts and ETFs are regulated and registered under the Collective Investment Schemes Control Act, 2002 (CISCA), ETFs trade on stock exchanges just like any other listed, tradable security. Unlike a unit trust, which can be bought or sold only at the end of the trading day, an ETF can be traded intraday, during exchange trading hours.

This Minimum Disclosure Document should be read together with the deed of the collective investment scheme and the fund's supplemental deed, which are available from EasyETFs (RF) (Pty) Ltd on request. Additional information, including a schedule of fees and charges and maximum commissions, application forms and the annual report, is available free of charge from EasyETFs (RF) (Pty) Ltd.

EasyETFs (RF) (Pty) Ltd is committed to Treating Customers Fairly. A copy of the conflicts of interest management policy and the complaints resolution policy is available on request. Complaints may be lodged with EasyETFs (RF) (Pty) Ltd in writing at the address below, and thereafter with the FAIS Ombud.
